* Data was not available in the Client Master File.

² Regional centers receive an 'N/A' designation within the table if fewer than 20 people responded to the survey item. CA average is reportable given that more than 20 people responded at the statewide level.

³ NCI CA average in green is significantly above the NCI national average; NCI CA Average in red is significantly below the NCI national average; NCI CA average in black is either within the weighted NCI national average or a question that was not tested for significance.

NCI CA Average percentage was compared to the weighted NCI national average, and the differences between the two were tested for both statistical significance as well as effect sizes. Effect sizes are used in addition to statistical significance because statistical significance of a state's result depends in part on the size of the state's sample—the larger the sample, the more likely it is that even a small difference will be found statistically significant. A statistically significant difference for a state with a large sample size, in and by itself, does not necessarily mean there is a practically significant difference. State percentages are categorized into three classes: 1) Significantly above the NCI average; 2) Within the NCI average range; 3) Significantly below the NCI average.
